

PDF Pre Flight Integration Module

THE GOAL

Integrate the complex and time consuming process of PDF Pre Flighting into a simple and automated job submission process. The Pre Flight Integration Module transforms Pre Flighting into a plain English validation step that can be used by anyone from the technically savvy pre press operator right down to the customer who knows little about design.

THE SOLUTION

The MAP Automation File Manager is a browser based integration tool that manages the artwork through the design process, the Quote Approval and the Job Creation. The customer takes responsibility for ensuring that the PDF specification is up to standard and the first you know of it is when the job is ready to plate.

The key point of difference is the secondary rule layer that allows you to go beyond a simple Pre Flight test. The integration tool allows you to check the PDF against your own printing specifications and the quote components including the number of pages, sizes and finishing attributes.

THE PAY BACK

Immediate response from an anonymous machine means that there's no one telling the customer that they got it wrong.

Get the job underway The customer completes the job submission once the PDF has passed Pre Flighting.

Save Time and Improve Quality Your Pre Press operators don't see the artwork until it's passed the Pre Flight test.

Not just a Pre Flighter The secondary rules layer allows you to verify artwork against the estimate and your own printing specifications.

AT A GLANCE
